Lab 9 Session Report

Exploratory Testing with an AI Co-Pilot

Target: User-provided Luxe Shop demo (alexou8.github.io/shop-demo/)
Date: 2026-10-26
Actual session: 00:53:20?00:57:15 +02:00 (approximately 3 minutes 56 seconds)
Planned time-box: 45 minutes ? not completed

Summary

The session explored product discovery, cart behavior, and adjacent checkout/navigation states. It confirmed the observed price-filter results, category deep-link state, ascending price order, cart quantity arithmetic, invalid-promo feedback, empty-cart transition, and basic untouched-checkout validation. No confirmed application defects were found. Search recovery remains an open question because browser automation could not reliably clear the search field.

Charter and coverage

Mission: check whether a shopper can find products, combine filters, sort the catalog, maintain correct cart quantities and totals, and reach checkout without unexpected behavior. The session covered price/category/rating filters, no-result search, Accessories deep link, ascending sort, cart arithmetic/decrement/removal, invalid promo code, checkout required-field validation without submission, and responsive navigation/overflow.

The site is third-party hosted and was not modified. No personal or payment data was entered, no order or newsletter signup was submitted, and the test-created cart was cleared at the end.

Observed results

Check	Observation
Under $50; Home + Under $50	One $45 product; combined filters returned zero products.
Rating 4.5+	Three products; review counts 156, 201, and 112.
No-result search	Query zzzxqv-no-match showed zero products; clear/recovery remained inconclusive.
Accessories deep link	Category selected and three products shown.
Price ascending	$45, $52, $58, $68, $98, $129, $135, $145, $149, $168, $179, $189; ordered correctly.
Tote quantity 3	Subtotal $567.00; tax $45.36; total $612.36.
Tote quantity 2	Subtotal $378.00; tax $30.24; total $408.24.
Invalid promo	NOPE123 showed ?Invalid promo code?; total unchanged.
Remove last item	Confirmation shown; empty-cart state displayed.
Checkout baseline	12 required fields; untouched form invalid. No submission.
Responsive check	Browser reported 312px CSS viewport and 300px document width; no horizontal overflow.

Bug list and source breakdown

Confirmed defects: None. Confirmed bug count is 0; AI-suggested and self-found bug percentages are not applicable because there are no confirmed bugs to classify. This is not a 0%/100% split.

The search-clear behavior is an unresolved question, not a confirmed defect. Automation could not reliably clear the field, so it needs a stable manual retest. Browser interaction instability and a URL is not defined error in a test helper were treated as tooling issues, not application failures.

Reflection

AI-suggested ideas structured checks around filter combinations, numeric sorting, cart invariants, recovery states, and checkout boundaries. They overlapped with normal tester instincts but made arithmetic and ordering explicit pass/fail checks. No bug was confirmed, so this short session cannot show whether AI uncovered bugs that would otherwise have been missed. Search recovery is the most useful follow-up for a full-length session.

Limitations and completion status

The lab requires a 45-minute session; only about 3:56 was completed. This report does not claim compliance with the full duration. Earlier observations were not individually timestamped when first made; the notes preserve their order using honest time intervals rather than invented exact times. The browser-reported responsive viewport differed from the requested emulated width. Findings are preliminary.

Supporting deliverables: Lab_9_Test_Charter.md and Lab_9_Timestamped_Session_Notes.md.
